The Human Anatomy and Physiology course is designed to introduce students pursuing careers in the allied health field to the anatomy and physiology of the human body.

Human Anatomy and Physiology - Irn.org

Our bodies contain numerous skeletal muscle organs - for example, the biceps brachii of the arm and the gastrocnemius of the leg. The muscles that move and support our body are attached to bones ...

Skeletal Muscle Organization: Connective Tissue and Layers

Producing movement is a common function of all muscle types, but skeletal muscle plays three other important roles in the body as well. Every one of our 600-odd skeletal muscles is attached to bone, or to other connective tissue structures, at no fewer than two points. Muscles are arranged in such a ...

Muscle Definition. A muscle is a group of muscle tissues which contract together to produce a force. A muscle consists of fibers of muscle cells surrounded by protective tissue, bundled together many more fibers, all surrounded in a thick protective tissue. A muscle uses ATP to contract and shorten, producing a force on the objects it is connected to.

Tissues are groups of cells that have a similar structure and act together to perform a specific function. The word tissue comes from a form of an old French verb meaning "to weave". There are four different types of tissues in animals: connective, muscle, nervous, and epithelial. In plants, tissues are divided into three types: vascular, ground, and epidermal.

The skeleton is the body part that forms the supporting structure of an organism. It can also be seen as the bony frame work of the body which provides support, shape and protection to the soft tissues and delicate organs in animals. There are several different skeletal types: the exoskeleton, which is the stable outer shell of an organism, the endoskeleton, which forms the support structure ...

Cancellous bone, also called trabecular or spongy bone, is the internal tissue of the skeletal bone and is an open cell porous network. Cancellous bone has a higher surface-area-to-volume ratio than cortical bone because it is less dense. This makes it weaker and more flexible. The greater surface area also makes it suitable for metabolic activities such as the exchange of calcium ions.
