Böjmotståndet relaterar den högsta böjspänning som uppstår i ett balktvärsnitt till det böjmoment som verkar på balken, $=$. Böjmotståndet kan uttryckas som böjtröghetsmomentet I delat med avståndet från neutralaxeln till tvärsnittets yttersta fiber. Böjmotståndet för böjning runt horisontalaxeln för en balk med rektangulärt tvärsnitt med bredden b och höjden h blir därför

In applied mechanics, bending (also known as flexure) characterizes the behavior of a slender structural element subjected to an external load applied perpendicularly to a longitudinal axis of the element.. The structural element is assumed to be such that at least one of its dimensions is a small fraction, typically 1/10 or less, of the other two. When the length is considerably longer than ...

En ingeniería, se llama resiliencia de un material a la energía de deformación (por unidad de volumen) que puede ser recuperada de un cuerpo deformado cuando cesa el esfuerzo que causa la deformación. La resiliencia es igual al trabajo externo realizado para deformar un material hasta su límite elástico: $= \int$ Para una probeta de material elástico lineal sometida a tensión axial ...
