Omnibus tests are a kind of statistical test. They test whether the explained variance in a set of data is significantly greater than the unexplained variance, overall. One example is the F-test in the analysis of variance. There can be legitimate significant effects within a model even if the omnibus test is not significant.

Analysis of variance (ANOVA) is a collection of statistical models and their associated estimation procedures (such as the "variation" among and between groups) used to analyze the differences among group means in a sample. ANOVA was developed by statistician and evolutionary biologist Ronald Fisher. In the ANOVA setting, the observed variance in a particular variable is partitioned into ...

The supermarket studied and the methodology of the analysis and modelling is detailed in this section. As Fig. 1 indicates, this assessment is based on the actual consumption data, dry-bulb temperature and relative humidity records for 2012. This data was divided into two data sets to be used in a multiple linear regression analysis to generate two equations, one for electricity and one for gas.

A separation between moderate and severe depression according to CGI criteria (4 or 5 points vs. 6 or 7 points) was achieved with maximum accuracy at cut-off scores of 31 points on the MADRS and 25 points on the HAMD 17. According to Fig. 2, these cut-off scores revealed an optimum of sensitivity and specificity (ROC curves). For the MADRS (<31 vs. ≥31 points), sensitivity and specificity was ...
