Multiple Optimal Solutions, Simplex Method Example, Linear Programming, Alternative optimal solutions, Example of Multiple Optimal Solutions, Operations Research. Multiple Optimal Solutions: Simplex Method. The optimal solution may not be unique, if the non basic variables have a zero coefficient in the index row ($z_j - c_j$). This implies that ...

Multiple Optimal Solutions: Simplex Method Example

Multiple Optimal Solutions: The concept of multiple optimal solutions is associated with the linear programming problems. The multiple optimal solutions will arise in a linear program with more than one set of basic solutions that can minimize or maximize the required objective function.

Multiple or Alternative optimal Solutions. In some of the linear programming problems we face a situation that the final basic solution to the problem. need not be only one, but there may be alternative or infinite basic solutions, i.e., with different product mixes, we.

I am interested in using Pulp to get multiple optimal solutions if they exist. Much of the literature out there leads me to believe that this is not possible with a programming package, but I did find this promising example.. Here is the code

The reduced cost for a non-basic variable is not enough to conclude that we have multiple optimal solutions. For that to be the case it is necessary also that this non-basic variable can enter the basis, in other words, it should have a proper pivot element in the column to be picked.

In the optimal primal simplex tableau, if we have a non-basic variable with a reduced cost of zero, can we say for sure the primal has multiple optimal solutions? Or can the same thing also happen when we have a degenerate unique solution? Thanks.

If the multiple optimal points you mention form a continuum, for example when the objective function has the form $f(A^*x)$ where the matrix A has non-zero null vectors, then your problem is ill-posed/unstable and needs to be reformulated. As the others have been saying, you should expect to get the same solution if run repeatedly on the same machine, the same input data, and from the exact same ...

two optimal solutions is itself an optimal solution. From an empirical viewpoint this is an important result because it admits that the number of positive components of an optimal solution be greater than the number of independent constraints. Hence, when multiple optimal solutions

no feasible solution. Each of these features will be discussed in this chapter. Second, the simplex method provides much more than just optimal solutions. As byproducts, it indicates how the optimal solution varies as a function of the problem data (cost coefficients, constraint coefficients, and righthand-side data).

It follows that the problem does not have an optimal solution. The feasible region of this problem is depicted in Figure LP-9. There, we see that the Simplex algorithm starts with the point (0, 0), follows the x 1-axis to the point (10, 0), rises ... Multiple Optimal Solutions

d) If the dual of a linear optimization problem has a degenerate basic feasible solution, then the primal problem must have multiple optimal solutions. e) The only way that the simplex method can get to a degenerate basic feasible solution at some iteration is when there is a tie in the min-ratio test in the previous iteration.
