In the 1920s and 1930s the so-called modern synthesis connected natural selection and population genetics, based on Mendelian inheritance, into a unified theory that applied generally to any branch of biology. The modern synthesis explained patterns observed across species in populations, through fossil transitions in palaeontology, and complex cellular mechanisms in developmental biology.

Adaptation is the evolutionary process where an organism becomes better suited to its habitat. This process takes place over many generations. It is one of the basic phenomena of biology. When people speak about adaptation, they often mean a 'feature' (a trait) which helps an animal or plant survive. An example is the adaptation of horses' teeth to grinding grass.

SparkNotes online free test prep. Until this chapter, we have focused almost entirely on translational motion, the motion of bodies moving through space. But there is a second kind of motion, called rotational motion, which deals with the rotation of a body about its center of mass. The movement of any object can be described through the combination of translational motion of the object's ...
