Entering the X^2 sum of 23.8872 and the degrees of freedom (32, one less than the 33 possible outcomes of the experiment) into the Chi-Square Calculator gives a probability of 0.85. This falls within the "fat region" of the probability curve, and thus supports the null hypothesis, just as we expected. Next, we invite our subject to attempt to influence the random output of our generator.

Engineering statistics combines engineering and statistics using scientific methods for analyzing data. Engineering statistics involves data concerning manufacturing processes such as: component dimensions, tolerances, type of material, and fabrication process control. There are many methods used in engineering analysis and they are often displayed as histograms to give a visual of the data as ...

Background: MADRS cut-off scores for moderate and severe depression were estimated in relation to the Hamilton Depression Rating Scale (HAMD 17) and the Clinical Global Impressions Scale (CGI). Method: HAMD 17, MADRS, and CGI ratings from patients with major depression (DSM-IV) were analyzed (N=85). Receiver operating characteristics (ROC) curves were applied.

Multinomial Application: Gives probability of exactly n_i outcomes of event i , for $i = 1, 2, \dots, k$ in n independent trials when the probability p_i of event i in a single trial is a constant. Used frequently in quality control and other industrial problems. Example: Four companies are bidding for each of three contracts, with specified success probabilities. What is the probability that a ...

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of

survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

In statistics, the studentized range is the difference between the largest and smallest data in a sample measured in units of sample standard deviations.. The studentized range, q , is named for William Sealy Gosset (who wrote under the pseudonym "Student"), and was introduced by him (1927). The concept was later presented by a number of actual students, Newman (1939) and Keuls (1952) and John ...

Summary: Finally there are tools that let us transcend 'correlation is not causation' and identify true causal factors and their relative strengths in our models. This is what prescriptive analytics was meant to be. Just when I thought we'd figured it all out, something comes along to make me realize I was wrong.
