Invertebrate is a term used to describe any animal without a backbone or spinal column. The group includes about 97 percent of all animal species; that is, all animals except vertebrates, (subphylum Vertebrata of the phylum Chordata), which have a backbone or spinal column. Invertebrates include simple organisms, such as sponges and flatworms, and more complex animals, such as arthropods and ...

Invertebrate - New World Encyclopedia

Germ layer is any of three cellular layers formed during animal embryogenesis that give rise through further differentiation to the various structures (organs, tissues) of the organism. These three primitive collections of cells, or first tissues, are the ectoderm (cells on the outside), endoderm ...

Evolved forms now appear quite modern. Human (Hominini tribe) – chimp (Panini tribe) divergence - 4.9 to 7.0 ma; Sahelanthropus tchadensis, possible oldest member of Family Hominidae, Subfamily Homininae, Tribe Hominini ~ 7 ma.

History of Life Across Geological Time - FOSSIL MALL

No discussion of evolution seems complete without bringing up the topic of the human eye. Despite its deceptively simple anatomical appearance, the human eye is an incredibly complicated structure. Even in this age of great scientific learning and understanding, the full complexity of the human eye has yet to be fully understood.
