The molecular mass, often called the molecular weight (MW), is the weight of all atoms in a given molecular formula. Molecular weight is measured in Atomic Mass Units, usually expressed as u or amu. In order to calculate the molecular weight of a formula, you'll need to add up the atomic masses of each element present.

Distribution of body fluids. In health, approximately 60% of an adult animal's body weight is water. Estimates of total body water in adult dogs that are neither very thin nor obese are 534 to 660 mL/kg. 26, 59 Total body water of adult cats also was determined to be approximately 60%. 56 There are some species and individual variations in total body water, likely related to age, sex, and ...

The repulsive energy goes up as $(d_i / R)^{12}$, where R is the distance between the atoms and d_i is the distance threshold below which the energy becomes repulsive. d_i depends on the types of atoms. The large exponent means that when $R < d_i$ then small decreases in R cause large increases in repulsion. Short range repulsion only matters when atoms are in very close proximity ($R < d_i$), but at ...

Ester names are derived from the parent alcohol and the parent acid, where the latter may be organic or inorganic. Esters derived from the simplest carboxylic acids are commonly named according to the more traditional, so-called "trivial names" e.g. as formate, acetate, propionate, and butyrate, as opposed to the IUPAC nomenclature methanoate, ethanoate, propanoate and butanoate.
