The use of metric prefixes dates back to the inception of the French metric system, in 1793. It was originally decided that the submultiples of all basic units would be prefixed with a Latin root, corresponding to the decimal divisor (deci for 10, centi for 100, milli for 1000), whereas the decimal multiples would be prefixed with a Greek root, corresponding to the decimal multiplier (deca for ...

A dynamical system is a manifold  $M$  called the phase (or state) space endowed with a family of smooth evolution functions  $\Phi_t$  that for any element of  $t \in T$ , the time, map a point of the phase space back into the phase space. The notion of smoothness changes with applications and the type of manifold. There are several choices for the set  $T$ . When  $T$  is taken to be the reals, the dynamical ...

An integer (the primitive `int`) in Java should always be 4 bytes long hence the type isn't dynamic. See Primitive Data Types.. However, if your purpose is just to create an empty byte array, then just create it. There is no need to fill it with zeros hence in Java, the default value for bytes is 0.

This formula states that the equivalent energy (E) can be calculated as the mass (m) multiplied by the speed of light ( $c = \sim 3 \times 10^8$  m/s) squared. Similarly, anything having energy exhibits a corresponding mass m given by its energy E divided by the speed of light squared  $c^2$ . Because the speed of light is a very large number in everyday units, the formula implies that even an everyday object ...
