Section 5: Muscular Tissue. In certain skeletal muscle fibers, namely the red or slow contracting muscle fibers, the nuclei may be found scattered throughout the sarcoplasm. Based upon structural/functional studies, living muscle fibers that appear red are designated, in man, as Type I muscle fibers.

These tissues include the skeletal muscle fibers, blood vessels, nerve fibers, and connective tissue. Each skeletal muscle has three layers of connective tissue (called "mysia") that enclose it and provide structure to the muscle as a whole, and also compartmentalize the muscle fibers within the muscle .

The outermost is called the epimysium, and it protects skeletal muscles from damaging friction that could occur as they move against other muscles and bones. The epimysium is a particularly important component in the anatomy of the skeletal muscles because it, along with other connective tissues, forms the muscle tendon.
