Summary. A TCP socket is an endpoint instance defined by an IP address and a port in the context of either a particular TCP connection or the listening state.. A port is a virtualisation identifier defining a service endpoint (as distinct from a service instance endpoint aka session identifier).. A TCP socket is not a connection, it is the endpoint of a specific connection.

So, my web server should unblock incoming connections on ports 80 and 433, does not need to worry about outgoing connections on those ports, but need to allow outgoing connection in the dynamic/ephemeral port range, is that right? And I'm still a bit confused with the outgoing thing: if a web client tries to connect to a site, the destination port would be 80, but the source port could be anyone.
