In statistical modeling, regression analysis is a set of statistical processes for estimating the relationships among variables. It includes many techniques for modeling and analyzing several variables, when the focus is on the relationship between a dependent variable and one or more independent variables (or 'predictors'). More specifically, regression analysis helps one understand how the ...

Multivariate Analysis of Variance (MANOVA)

In statistics, linear regression is a linear approach to modeling the relationship between a scalar response (or dependent variable) and one or more explanatory variables (or independent variables).The case of one explanatory variable is called simple linear regression.For more than one explanatory variable, the process is called multiple linear regression.

Keywords: MANCOVA, special cases, assumptions, further reading, computations Introduction. Multivariate analysis of variance (MANOVA) is simply an ANOVA with several dependent variables. That is to say, ANOVA tests for the difference in means between two or more groups, while MANOVA tests for the difference in two or more vectors of means. For example, we may conduct a study where we try two ...

Introduction: In countries with broad access to effective antiretroviral therapy (ART), the clinical benefits have been dramatic. Far fewer people are progressing to AIDS, hospital AIDS wards have practically emptied, and the age-adjusted death rate from HIV/AIDS has declined by more than 70%.() Adherence to ART has emerged as both the major determinant and the Achilles' heel of this success.
