Modern Introduction To Differential Equations

A partial differential equation (PDE) is a differential equation that contains unknown multivariable functions and their partial derivatives. (This is in contrast to ordinary differential equations, which deal with functions of a single variable and their derivatives.)PDEs are used to formulate problems involving functions of several variables, and are either solved in closed form, or used to ...

Numerical methods for ordinary differential equations are methods used to find numerical approximations to the solutions of ordinary differential equations (ODEs). Their use is also known as "numerical integration", although this term is sometimes taken to mean the computation of integrals.Many differential equations cannot be solved using symbolic computation ("analysis").
