Modern Compiler Implementation In Java

A compiler is a computer program that translates computer code written in one programming language (the source language) into another programming language (the target language). The name compiler is primarily used for programs that translate source code from a high-level programming language to a lower level language (e.g., assembly language, object code, or machine code) to create an ...

A Java virtual machine (JVM) is a virtual machine that enables a computer to run Java programs as well as programs written in other languages that are also compiled to Java bytecode.The JVM is detailed by a specification that formally describes what is required of a JVM implementation. Having a specification ensures interoperability of Java programs across different implementations so that ...

11.1. A Quick Introduction to Classical Compiler Design. The most popular design for a traditional static compiler (like most C compilers) is the three phase design whose major components are the front end, the optimizer and the back end (Figure 11.1).The front end parses source code, checking it for errors, and builds a language-specific Abstract Syntax Tree (AST) to represent the input code.

The LLVM Project is a collection of modular and reusable compiler and toolchain technologies. Despite its name, LLVM has little to do with traditional virtual machines.

When you define an abstract method, you are telling the compiler that any subclasses must provide an implementation (or also declare themselves abstract).. You implement the abstract method in a subclass.. Remember, you cannot create instances of abstract classes themselves. The entire point of an abstract method is to tell the compiler that you want subclasses to provide the functionality.

The article illustrates an approach to automated acceptance testing in developing software with Java. Acceptance tests directly tie into software requirements specification and the key for achieving maintainable tests is proper handling of traceability between the requirements and implementation as well as between the requirements and acceptance tests.

Table 1 – Processor performance circa 1997. A 200 MHz MIPS R10000, a 300 MHz UltraSPARC and a 400 MHz Alpha 21164 were all about the same speed at running most programs, yet they differed by a factor of two in clock speed. A 300 MHz Pentium II was also about the same speed for many things, yet it was about half that speed for floating-point code such as scientific number crunching.
